

I would like to associate .doc files in my email with the Star Office text editor... using Netscape messenger for mail on Solaris 7. I know how to setup the associations, I am just unsure if there is an executable for the Star Office text editor... I pointed it to the soffio script and it successfully launched Star Office, but did not bring in the document into the text editor.

Thanks ahead of time for any info!

Would anyone know the property for out of office text? EDHUB.H has PHOF STATE, which tells if the person is out of the office, but I can't find the property for the accompanying text.

TIA, DAVE
Hallo zusammen,
weiss jemand, ob es die Hochlohnzeit gibt aus einem Star Office Text ein PDF zu erstellen?

of text boxes.

These boxes are a pain to edit!

How can I "merge" the text boxes into a plain and simple .doc file using Office 2000?

Thanks

: What issue is this? Does someone have a good summary of some of the key type copyright issues?
Here are the US Copyright Office's policy decisions of 1988 and 1992 on the non-copyrightability of computer typesetters, which also set forth legal requirements up to those dates (documents in plain text format).

Character image where dots are so close together that when reduced to actual printed or displayed size, they form an image or character without the need to connect the dots.

To create a digitized typeface from an existing analog typeface, analog visual representations of characters are scanned and represented as a collection of discrete picture elements, called pixels. Pixels can be efficiently encoded in digital form on any convenient storage medium. The medium can be magnetic (e.g. tape, disk or diskette), electronic (e.g., ROM or cartridge), or optical (e.g., video-disk).

The encoded digitized representation is then organized as bits of information, manipulated and changed (usually reduced to minimize storage requirements) and placed in a format usable with a specific program and compatible digital typesetter.

Typically, a specialized computer circuit in the

Does MS Office 2000 have built-in speech to text support for agents? I clearly, it's easy to drop a file like peedy.doc into my auto's mailbox. Is there an easy way to get it to read text balloons.

Regards
I sent my last post without adding question #2. Sorry. My site is very text intensive. I write articles in Microsoft Word, so I'm wondering what is the best way to save them so that dreamweaver understands its formatting. Saved as a normal text file, or save as web page style that I created does not understand the paragraph breaks, so that I have to manually go in and hit RETURN so that my first line is indented. I would like to save the file as HTML,

These key documents are omitted (omitted?) from the comp.doc.ms.faq. They raise billions of questions.

SUMMARY

printing device reads the information from the storage media or cartridge and uses a laser beam to draw a representation of a particular typeface character on a particular surface in direct response to the digital data and instructions in the media or cartridge. This process is then transferred by a process, similar to printing, to paper from which the information is received by the printer or drive.

There are basically three techniques applied to represent characters digitally: bitmapping, outlining and stroke definition. A digitized typeface could be prepared by bitmapping alone, but it is more common to use a combination of the three techniques to improve the quality of the typeface.

Bitmapping is a dot-by-dot representation of each character. A

would I? I want to do the background and buttons, etc. in Dreamweaver
I'm using PowerBook G3 from 1999, running Office 98 on OS 9.0.4; there are old papers I wrote in college, written in an older version of Word (Office sees them as "Microsoft Word 1.x-5.x document"), and new documents, created in Office 98 ("Microsoft Word 97-98 document").

I have to display a list of users who have checked out of office flag set. How do I get a list of users from exchange??? I tried that using CDO but whenever I access a user's mailbox (with all the permission as Admin/SecLoc Admin) to check the OUTOFFICE flag, it logs a success audit entry (Event ID: 1016, this is as per design in behaviour) in the event viewer and there is no way I can suppress that. Is there any other way I can get the OUTOFFICE message and flag? I am using Exchange Server 5.5.
Thanks
my delphi application send any text or any crap to ms word. Its OK, but I have to manually go in and hit RETURN so that my first line is indented. I would like to save the file as HTML,

The purpose of this notice is to inform the public that the Copyright Office has decided that digitized representations of typeface designs are not registrable.

Under section 410(a) of the Copyright Act of 1976, title 17 of the United States Code, 17 USC 410(a), the Copyright Office has decided that digitized representations of typeface designs are not registrable. This decision is based on the Copyright Office's determination that digitized representations of typeface designs are not original works of authorship. The Copyright Office's decision is based on the Copyright Office's determination that digitized representations of typeface designs are not original works of authorship. The Copyright Office's decision is based on the Copyright Office's determination that digitized representations of typeface designs are not original works of authorship.

different bitmaps is required for each size and style of a character and there are several ways to create a bitmapped typeface. The most popular is by scanning and white image, some converted to digital outlines, represented as a set of vectors. The outlines can consist of straight line segments only or straight line segments along with abstract representations of the character. The digital information, comprised of instructions and data, is fixed by a computer operator who visually inspects only the outlines of characters. In order to form a completed letter on a screen display or on paper when printed out, an outline font program instructs a

I have two kinds of Word documents on my Macintosh. The PowerBook G3 from 1999, running Office 98 on OS 9.0.4; there are old papers I wrote in college, written in an older version of Word (Office sees them as "Microsoft Word 1.x-5.x document"), and new documents, created in Office 98 ("Microsoft Word 97-98 document").

Suddenly, just recently, word refuses to open (automatically convert) the old documents - it says "There is not enough memory to load the Microsoft Office 98 Assistant Shared Library." Nothing's changed on my computer in ages; I haven't installed (or uninstalled) anything. It just refuses to open the docs

The Copyright Office received 19 initial and reply comments in response to its Notice.

Two comments stated that the "work" is a computer program which operates on a data stream and is configured in a particular format. Another comment explained that registration of the typeface itself, rather than the digitized representation, should be the subject of copyright protection.

The second comment opposing registration declared that bitmaps are static data, fixed representations of images at a given resolution. This comment compares the static dot pattern representation of

created in the older version of Word -- I have to allow through that dialogue box about a dozen times, then Force-quit Word (since it's frozen with an empty document onscreen). The "Word 4.x-5.x for the Macintosh" text converter is still in the office "Text Converters" folder; I've tried moving it (and the other converters) to the main Extensions folder and back; I've tried turning off most of the extensions to see if there's an extensions conflict; I've tried allocating more memory to Word. Nothing works.

Perhaps most disturbingly, I started up from the System 5 disk and tried to do a clean install -- and it wouldn't let me. It said something was wrong with the disk (which I've used to do clean installs and whatnot many times in the past). I'm hoping not to lose all those old papers. Does anyone have any insight?

I am following up a report of file names being lost on text attachments going into Office Server via PHOF-HR (MS mode) on an Alpha.

The option `ALCOMPEN HOME=3` is set, which causes PHOF-HR to use and produce the "message wrapper" that all file names to be retained. This works fine for most attachments (although the filenames on outbound messages have null paths like `C:\HYDRIVABLE\...` but that's another story). Incoming attachments such as Word, etc. etc. in the original name from the Content-Disposition headers. Attachments arrive as UNTITLED

applied in a notational system and are intended to be embodied in articles whose intrinsic utilitarian function is for use in composing text or graphics.
